## 1.2.

1. Название: cellular tumor antigen p53 isoform X1. Организм: Gorilla gorilla gorilla.
2. E-value = 0 (то есть вероятность случайного совпадения меньше, чем округление для компьютера)
3. Это означает что вероятность случайного такого же или лучшего выравнивания в базе нр очень мала. А так как база большая, то найденная последовательность практически такая же что искалась. Raw Score это сумма баллов за совпадения/замены по матрице, но он не учитывает размер базы данных. Чем больше база, тем выше вероятность случайного похожего совпадения. При одном и том же Raw Score в большой базе это может быть случайность, а в маленькой значимое совпадение. E-value нормирует с учётом размера базы, поэтому говорит о статистической значимости совпадения.

## Задание 2

### 2.1

Последовательность:

ATTGCAA

1. У нас есть нуклеотидная последовательность (мРНК), а ищем гомологичные белки, т.е. нужно использовать **blastx**, т.к. он транслирует нуклеотидный запрос во все 6 рамок считывания и ищет совпадения в белковой базе данных.

Остальные инструменты нужно использовать, когда:

**Blastn**

Ищем: Нуклеотидную посл.

Где: Нукл. посл.

**Blastp**

Ищем: Белок

Где: Белки

**tblastn**

Ищем: Белок

Где: Нукл. посл.

**tblastx**

ИЩЕМ НА УРОВНЕ БЕЛКА

Ищем: Нукл. посл.

Где: Нукл. посл.

## 2.2.

Результат запуска blastx см. ниже.

## 2.3.

Верной оказалась рамка считывания +3 (см. ниже картинку).

## 2.4.

blastx надёжнее, т.к. автоматически транслирует последовательность во все 6 рамок считывания и ищет по всем сразу. При ручной трансляции через сторонний транслятор нужно заранее знать правильную рамку считывания, т.к. если выбрать неверную, то получится неправильный белок и поиск не найдёт гомологов. (+ в мРНК могут быть UTR-области, ошибки аннотации или сдвиги рамки, blastx учитывает это)

|                                     | Description                                                                                                                                                        | Scientific Name | Max Score | Total Score | Query Cover | E value | Per. Ident | Acc. Len | Accession |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------|-------------|-------------|---------|------------|----------|-----------|
| <input checked="" type="checkbox"/> | RecName: Full=Myoglobin; AltName: Full=Nitrite reductase MB; AltName: Full=Pseudoperoxidase MB [Danio rerio]                                                       | Danio rerio     | 119       | 119         | 97%         | 2e-29   | 41.61%     | 147      | Q6VN46.3  |
| <input checked="" type="checkbox"/> | RecName: Full=Cytoglobin-1; AltName: Full=Nitric oxygen dioxygenase CYGB; AltName: Full=Nitrite reductase CYGB; AltName: Full=Nitrite reductase CYGB [Danio rerio] | Danio rerio     | 72.7      | 72.7        | 99%         | 1e-14   | 26.75%     | 174      | Q8UUR3.2  |

Два результата. Значения первого: E-value =  $2 \cdot 10^{(-29)}$ , Bit Score = 119, Query Cover = 41,61%.

### 3.4.

PAM30 создана для близкородственных последовательностей, она сильно штрафует за любые замены. Поэтому на умеренно далёких гомологах (человек и *Danio rerio*) она даёт худший E-value, так как замены между ними неизбежны. BLOSUM62 создана для умеренно далёких последовательностей и лучше прощает консервативные замены, поэтому даёт более значимый E-value в данном случае.

PAM30 лучше подходит для поиска близких гомологов, BLOSUM62 для эволюционно далёких, как в этом задании.

## Задание 4.

### 4.3.

Лучший хит: RecName: Full=E3 ubiquitin-protein ligase RING1; AltName: Full=RING-type E3 ubiquitin transferase RING1; AltName: Full=Sex comb extra protein; AltName: Full=dRING protein; AltName: Full=dRING1 [Drosophila melanogaster]

### 4.4.

Query Cover = 3%, Per. Ident = 37,31%. Белок очень слабо похож на человеческий. Query Cover = 3%, т.е. маленький фрагмент запроса нашёл совпадение. Идентичность 37% в этом коротком участке, т.е. небольшое сходство есть. Белок можно считать очень далёким гомологом или функционально неродственным человеческому.

### 4.5.

На вкладке Graphics:

**NP\_009225.1 breast cancer type 1 susceptibility protein isoform 1 [Homo sapiens]**  
lcl|Query\_216047

На графике видно, что совпадения покрывают лишь небольшой участок в начале последовательности, тогда как остальная часть белка не выровнена.

Белок сохранился не целиком, а консервативен только отдельный домен в N-концевой области. Этот домен в ходе эволюции находился под сильным функциональным отбором и сохранился у разных организмов, тогда как остальная часть белка эволюционировала быстрее и стала уникальной для человека. Такая картина типична для многодоменных белков.
